pengenalan

- Kumpulan POISK menawarkan penyelesaian masa & kos efektif untuk merombak cara dan cara cari gali petroleum.
- Dengan kepakaran penderiaan jauh yang bijak serta kerja lapangan yang menyokong yang diperolehi daripada teori Resonans Magnetik Nuklear (NMR), anomali yang berkaitan secara komersial dikenal pasti, digariskan dan dibuktikan secara geologi.
- Pengetahuan awal tentang kebolehlaksanaan ekonomi kluasan disediakan; cadangan mengenai kawasan terbaik untuk seismik yang disasarkan (jika dilakukan); pengenalpastian dan pengesahan geologi tempat terbaik untuk akta penilaian disediakan hasil daripada kajian RS-NMR.
- Penerapan tiga disiplin bersepada ketajaman penderiaan jauh yang dipatenkan, kerja lapangan NMR yang disahkan secara saintifik dan pengesahan penemuan G&G yang muktamad, menggunakan kit alat yang kuat dan inovatif yang menganggu dan cekap.

Pasukan: Pasukan pemimpin yang mantap dalam bidang mereka

MBA from Henley Business School London and M.Tech in Applied Geophysics from IIT ISM Dhanbad. 18+ years experience. Have worked with Reliance Industries Ltd. in Seismic operations.

Kumpulan POISK ialah wakil Universiti Negeri Sevastopol, persatuan 11 institut dan lebih daripada 12 makmal.

Telah melaksanakan lebih daripada 350 projek dengan teknologi NMR-RS.

Wave Geo-services ialah syarikat Pengurusan Projek, menyediakan perkhidmatan pemerolehan, pemprosesan dan tafsiran data seismik darat/laut di India dan Asia Tenggara.

Gambaran Keseluruhan Teknologi

- Teknologi inovatif pencarian jauh untuk mineral tersembunyi adalah berdasarkan kaedah tradisional dan proprietari **penderiaan jauh Bumi dan peralatan NMR khas Kumpulan POISK.**
- Ciri utama NMR ialah kekerapan resonans bahan tertentu adalah berkadar terus dengan kekuatan medan magnet yang digunakan. Ia dieksplotasi dalam teknik pengimejan; jika sampel diletakkan dalam medan magnet maka frekuensi resonans nukleus sampel bergantung pada di mana dalam medan ia berada.
- Medan magnet frekuensi radio menembusi kedua-dua batu lembut dan keras yang membolehkan pemetaan anomali resolusi lebih tinggi dan boleh digunakan dengan mudah dengan bot, kapal terbang, helikopter atau trak untuk penerokaan.
- Geoholografik jauh dicipta daripada set instrumental (peralatan pegun dan medan) untuk mencari jauh dan plot kontur sumber mineral tersembunyi (minyak, gas, gas kondensat, dan mendapan bijih), dan pengumpulan air minuman, dan geotermal, serta terpencil. penentuan ciri geologi penting tempat tidur mereka hingga kedalaman 6000m.

Bagaimana ia berfungsi

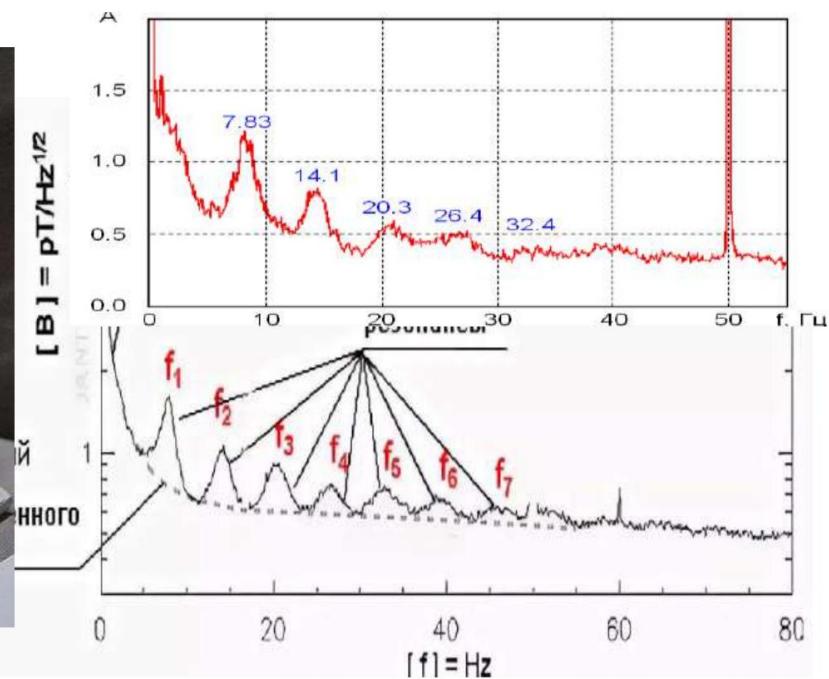

| LANGKAH 1 Persampelan + Pangkalan Data | LANGKAH-2 Penderiaan Jauh + Data Memproses | LANGKAH-3 Tinjauan Lapangan |
|---|---|---|
| Menganalisis sampel Minyak/Gas dari medan berdekatan (jenis permainan yang sama). | Tinjauan satelit kawasan minat dan pengimejan gambar analog | Pemeriksaan tambahan ke atas anomali yang dikenal pasti menggunakan peralatan lapangan |
| Merekodkan spektrum frekuensi unsur rujukan yang terdapat dalam sampel | Memproses imej dengan nanogel yang bijak dan peningkatan dalam saiz kecil reaktor nuklear | Tinjauan lapangan menggunakan peralatan NMR khas kumpulan POISK |
| Ujian makmal sampel menggunakan peralatan POISK khas | Kenal pasti sempadan pengumpulan hidrokarbon dengan memproses imej satelit digital dan analog yang diambil dalam pelbagai julat frekuensi spektrum ultraungu dan IR yang boleh dilihat. | Memplot kontur anomali yang berkaitan dengan pengumpulan petroleum pada peta kawasan tinjauan. Menjana bahagian geologi dengan kedalaman pengumpulan hidrokarbon |

Langkah I – Persampelan + Pangkalan data

1. Kumpul dan analisa sampel minyak dari ladang berdekatan (permainan yang sama),
2. Kenal pasti elemen rujukan dalam sampel,
3. Rekodkan spektrum frekuensi unsur rujukan,
4. Simpan pangkalan data unsur rujukan untuk kajian hidrokarbon selanjutnya

Unsur-unsur tertentu (cth V, Ni, Cu, Fe, Mn, Mo, Cr dll) dibezakan dalam komposisi minyak, yang merupakan penanda utama (“unsur rujukan”) dalam pengenalpastian minyak. Setiap elemen mempunyai frekuensi ayunan nukleus sendiri (yang wujud).

Langkah I – Persampelan + Pangkalan data

Langkah I – Persampelan + Pangkalan data

Proses Analisis Contoh

- Kehadiran logam nadir bumi, terutamanya tungsten dan titanium (dalam kuantiti mikro) ditentukan dalam sampel minyak. Mengikut nisbah mereka, asal minyak boleh ditentukan, iaitu, seseorang mungkin mengetahui, sebagai contoh, minyak dari negara mana. Pendekatan yang sama dilaksanakan dalam tinjauan NMR, iaitu spektrum NMR unsur-unsur ini boleh dikenali apabila kita mencari pengumpulan minyak.
- Dalam sampel minyak, komposisi logam lain dianalisis, kandungannya berbeza dengan ketara daripada spektrum NMR yang lain. Ia juga boleh digunakan sebagai faktor diagnostik tambahan minyak di rantau tertentu, iaitu ia adalah apa yang dipanggil matriks carian "ujian".
- Spektrum elektromagnet bersepadu (spektrum maklumat dan pengukuran) direkodkan daripada sampel minyak oleh atom logam yang mengujakan apabila sampel minyak dimasukkan ke dalam "relau pengatoman" (suhu = 2500 °C) menggunakan peralatan spektrum khas yang merupakan sebahagian daripada kemudahan "Poisk" kompleks.
Oleh itu, kami merekodkan apa yang dipanggil matriks diagnostik carian berfungsi.

Langkah II – RS + Pemprosesan data

1. Lakukan tinjauan satelit dan pengimejan Kawasan Menarik (AOI).
2. Proses bahan imej dengan nanogel dan penyelesaian yang bijak untuk menguatkan dan menyerlahkan anomali spektrum yang berkaitan dengan pengumpulan petroleum.
3. Meningkatkan pemprosesan imej dalam reaktor nuklear bersaiz kecil,
4. Plotkan sempadan awal pengumpulan hidrokarbon pada peta AOI.

Langkah II – RS + Pemprosesan data

Tafsiran gambar analog ruang , pengenalpastian dan persempadan kawasan yang mempunyai anomal

1

Peninjauan foto kawasan carian

2

Memproses imej data analog satelit dengan penyelesaian nanogel

4

Memindahkan sempadan kawasan cahaya daripada gambar ke peta kawasan carian

3

Pendedahan imej dalam reaktor IR-100

5

Hasil kerja
WORKSRESULTS

- Sempadan kawasan anomali yang dikenal pasti;
- Kontur kawasan hidrokarbon, badan bijih dan gugusan air bawah tanah.

Langkah II – RS + Pemprosesan data

Apa yang kami rakam dan proses dalam Foto Analog?

- Pada imej satelit analog, medan elektromagnet ciri (spektra) yang wujud pada setiap jenis "deposit" (minyak, air, bijih, dll.) direkodkan. Medan elektromagnet berciri (berfrekuensi tertentu) terbentuk di atas endapan (anomali), iaitu di permukaan tanah disebabkan oleh pelbagai proses kimia, haba dan elektrokimia dalam batuan dengan penghijrahan minyak, gas (logam lain dalam bijih) yang berpanjangan dari kedalaman yang besar. ke permukaan tanah.
- Teknologi Poisk membolehkan untuk "memvisualisasikan" pada imej satelit analog medan elektromagnet ciri dalam bentuk "zon kecerahan tinggi", selepas pemprosesan khas kertas foto menggunakan reagen kimia (nanogel), fosfor, pemeka (lapisan campuran), yang dipilih untuk setiap jenis deposit (minyak, gas, bijih, air masin, air tawar, dll).
- Pemprosesan imej satelit digital dalam spektrum boleh dilihat hanya menyediakan tanda-tanda (imej) yang boleh dilihat "utama" bagi pelbagai anomali atau kawasan penyebaran mineralisasi pelbagai logam (tembaga, emas, molibdenum, dll.).
- Ketepatan pengenalpastian dan persempadanan anomali pelbagai mineral dengan pemprosesan imej analog (teknologi berpaten Poisk) adalah jauh lebih tinggi daripada kaedah tradisional dan pendekatan penerokaan geologi.

Langkah III – Tinjauan lapangan + Teori

1. Frekuensi resonans atom molekul rujukan dikenakan/dimodulatkan pada frekuensi pembawa oleh penjana frekuensi tinggi.
2. Medan elektromagnet frekuensi tinggi, ciri unsur sampel rujukan, teraruh di atas pengumpulan minyak oleh frekuensi bergemanya .
3. Setiap medan elektromagnet ciri direkodkan secara berurutan oleh peranti penerima sensitif yang ditala untuk mendaftarkan frekuensi resonans atom sampel rujukan , memastikan pengenalan yang munasabah bagi pengumpulan petroleum.

Sempadan tepat
pengumpulan petroleum
diplot pada kawasan-
kawasan -kepentingan.

Langkah III – Tinjauan lapangan + Teori

Pemeriksaan kawasan anomali dengan peralatan lapangan, pemilihan titik untuk penggerudian dan pengiraan rizab

1

Penapisan kawasan dan sempadan tapak

2

Menentukan kedalaman ufuk pada titik pengukuran dengan peralatan medan

4

Membina lajur dalam

3

Membina kepingan kedalaman mengikut titik pengukuran

5

Boleh diantar

Selepas Langkah-1 & 2

Ketepatan - 60% hingga 80%

- 1. Peta dengan anomali yang dikenal pasti berkaitan dengan pengumpulan petroleum**
- 2. Keratan rentas dengan kedalaman kejadian**
- 3. Cadangan tempat menggerudi dan teras**

Selepas Langkah-3

Ketepatan adalah kira-kira 90%.

- 1. Peta dengan kawasan yang digariskan dengan tepat anomali**
- 2. Keratan rentas dengan kedalaman yang lebih tepat kejadian**
- 3. Ketebalan takungan berpotensi**
- 4. Anggaran volum**

Laporan Akhir mungkin memberikan bukti geologi (pilihan) termasuk: a - Analisis tetapan geologi, b- Penilaian Sumber

Boleh diantar

Dalam produk ini, istilah 'rizab' menandakan BAKAL SUMBER, atau sumber boleh pulih muktamad yang akan dihasilkan sekiranya prospek ini menjadi a padang. Ia tidak menepati definisi 'rizab terbukti' yang disediakan oleh AS Suruhanjaya Keselamatan dan Bursa.

Ciri dan Faedah Utama

1. Teknologi yang sangat menjimatkan kos dan masa untuk mengenal pasti kawasan tumpuan hidrokarbon dan mineral lain.
2. Teknologi ini unik dengan pemprosesan data imej analog.
3. Kebolehpercayaan keputusan yang diperolehi berdasarkan data NMR & penderiaan jauh selepas Peringkat-1 (Langkah-1&2) adalah 60%-80%, dan selepas melakukan kerja lapangan di Langkah-3 adalah kira-kira 90%.
4. Kawasan pemerolehan data Seismik 3D boleh dimuktamadkan tanpa melaburkan masa dan wang dalam tinjauan seismik 2D dan geofizik lain.
5. Jika seismik sudah dilakukan di mana-mana kawasan, teknologi NMR-RS ini membantu dalam mengenal pasti dan mengesahkan lokasi penggerudian. Juga membantu dalam penilaian kemungkinan rizab hidrokarbon, bijih dan air bawah tanah sebelum penggerudian.
6. Teknologi ini sangat berguna dalam rupa bumi terpencil dan mencabar secara topografi seperti Manipur, Mizoram, Nagaland, J&K negeri India.
7. Pengesanan air hidrokarbon dan geoterma sehingga kedalaman 5000 m, badan bijih sehingga 1500m, air minuman bawah tanah hingga kedalaman 1000 m.
8. Resolusi menegak anomali selepas Langkah-2 ialah 100m dan selepas Langkah-3 ialah 30- 50m.
9. Jumlah masa bagi pelaksanaan kerja penerokaan NMR-RS di kawasan tinjauan seluas 1000 km persegi. adalah lebih kurang 2 bulan untuk Langkah-1 & 2, dan 5-6 bulan untuk Langkah-1,2 &3.

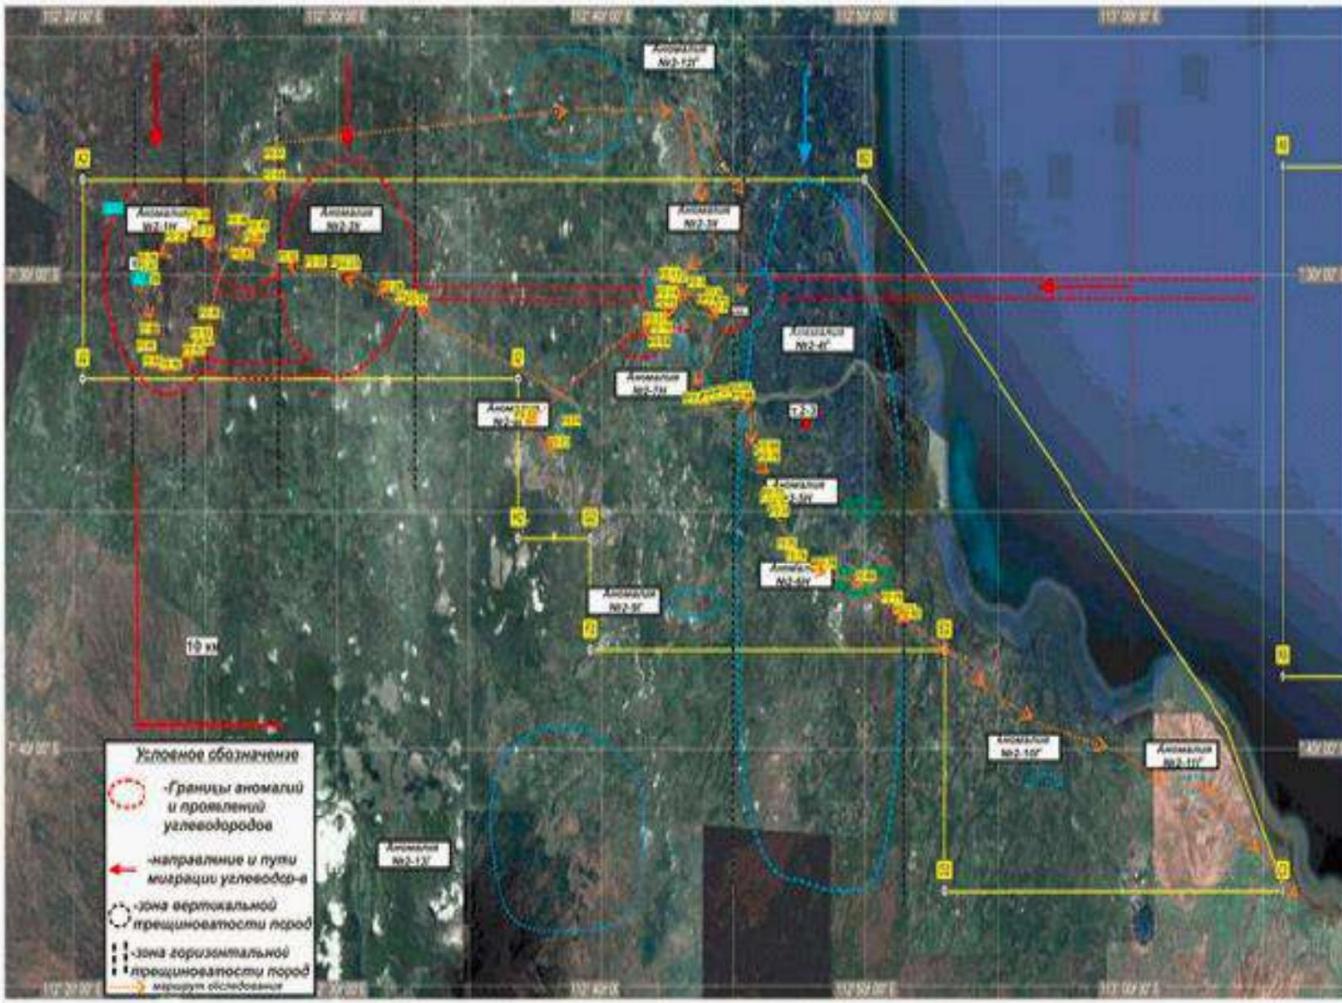

Projek

- Minyak, Gas dan Kondensat gas
- Arang
- Uranium
- Zink,
- Plumbum •
- Molibdenum •
- Kuprum • Bijih polimetallik
- Berlian dll.

Re: SBRDSS report reference

In accordance Contract No.1, 28.11.2011 between RussTechno Indonesia and Sevastopol State University, Sevastopol's specialists (head of team - Ph.D. Kovalev N.I.) were involved with a set of equipment "Poisk" for remote search for oil and gas with identification its depth and deposit on Brantas Block in Java, Indonesia total area 3050 km². Off-shore – 2 blocks and On-shore – 3 blocks.

Previously, these areas were studied by traditional seismic methods and have more than 30 wells.

The study was performed in February 2012. Based on the results of study on Brantas Block by using remote method SBRDSS Sevastopol specialists discovered total 31 hydrocarbon anomalies.

SBDRSS remote method was proven by compare with seismic date available in Lapindo Brantas company. This method is cost effective and very accurate in depth and deposit result.

Regards,

Thanigasalam
President Director

Kajian Kes IV

License block Pel-105 in Aus- tralia

Well Pine-1 location was changed as suggested the identified anomaly. The well has been drilled and proved to be productive.

Perkara Pertimbangan

1. Teknologi yang sangat menjimatkan kos dan masa untuk mengenal pasti kawasan tumpuan hidrokarbon dan mineral lain.
2. Teknologi ini unik. Tiada pemprosesan imej analog tersedia di dunia.
3. Kebolehpercayaan keputusan yang diperolehi berdasarkan data NMR & penderiaan jauh selepas Langkah-1 & 2 ialah 60%-80%, dan selepas melakukan kerja lapangan di Langkah-3 adalah kira-kira 90%
4. Kawasan pemerolehan data Seismik 3D boleh dimuktamadkan tanpa melaburkan masa dan wang dalam tinjauan seismik 2D dan geofizik lain.
5. Jika seismik sudah dilakukan di mana-mana kawasan, teknologi NMR-RS ini membantu dalam mengenal pasti dan mengesahkan lokasi penggerudian. Juga membantu dalam penilaian kemungkinan rizab hidrokarbon, bijih dan air bawah tanah sebelum penggerudian.
6. Teknologi ini sangat berguna dalam rupa bumi terpencil dan mencabar secara topografi seperti Manipur, Mizoram, Nagaland, J&K negeri India.
7. Pengesan air hidrokarbon dan geoterma sehingga kedalaman 5000 m, badan bijih sehingga 1500m, air minuman bawah tanah hingga kedalaman 1000 m.
8. Resolusi menegak anomali selepas Langkah-2 ialah 100m dan selepas Langkah-3 ialah 30- 50m.

9. Jumlah masa bagi pelaksanaan kerja penerokaan NMR-RS di kawasan tinjauan seluas 1000 km persegi. adalah lebih kurang 2 bulan untuk Langkah-1 & 2, dan 5-6 bulan untuk Langkah-1,2 &3.
